COURSE DESCRIPTION
Genetics has been at the forefront of discourse concerning the concept of “race” in humans. This course explores human history, human variation, human identity, and human health through a broad range of enduring and emerging themes and challenging questions related to race and genetics (and now genomics) on a global scale. Students will acquire knowledge and skills required for integrative analysis of the relevant scientific, ethical, sociopolitical, cultural, and psychological issues. Open to undergraduates at all levels from any discipline in the arts, humanities, science (natural, social, and formal), and engineering.

FALL 2015
Mondays and Wednesdays
11:45am - 1:00pm
Instructor: Charmaine DM Royal, PhD
